

# **EY4**

## **SMART WIDESCREEN INSTALLATION GUIDE**

**THE SHOW AFTER  
INSTALLING EY4**

**1**

Install the EY4 display to the mount.

**2**

Remove the handlebar cover from your scooter, and fix the mount with the EY4 on the handlebar.

3

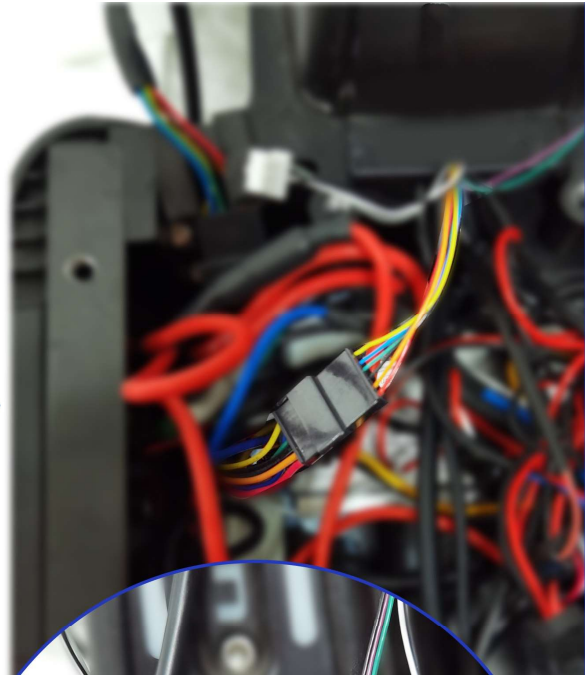

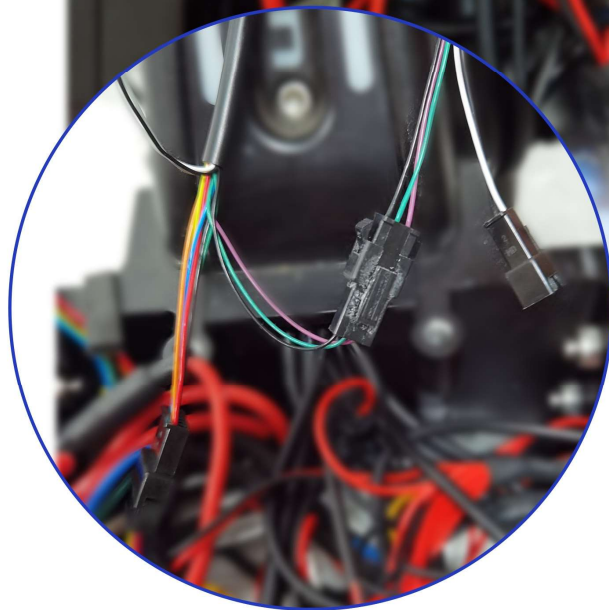

**Install the accelerator and bracket to the handlebar.**

(Generally, we organize the wiring in the steering togetherwith the display cable.)

**4** Organize the EY4 wires into the steering, and there are three sets of wires that need to be connected:

- 6-core wire directly connected to the controller with original EY3 wire interface.
- 3-core wire connects to accelerator.
- 2-core wire connects to nothing.

\*Note: The 2-core wire is for the light control. And old model does not have a light control program. So the wire needn't to connect, no turn signal and can't control LED light through APP.

# 5

There are two sets of wires from the accelerator.

- 3-core wire connects to EY4.
- 2-core wire connects to 12V power, to power the lights in accelerator.

\*Note: We provide a one-to-two wire, which can split the light wire from the scooter to connect to the light of accelerator. Better to connect to DC directly without going through the light switch, otherwise the accelerator has no light before you turn on the light switch.
